The Arrow Arterial Embolectomy Catheter gives clinicians a way to more effectively remove fresh, nonadherent, soft emboli, thrombi and blockages from arterial vessels.

**SAFE, DURABLE, EASY TO GUIDE**

The user-friendly features start with this catheter’s ability to accommodate a larger-than-average guidewire, which helps simplify and speed insertion.

The entire over-the-wire balloon catheter is engineered from flexible, kink-resistant polyurethane. It’s simple to guide directly to the blockage, to artery bifurcations (junctions) or to areas where restrictive narrowing has occurred, and removes risk of reaction to latex.

Markings every 10 cm allow you to easily gauge the depth of insertion, while the highly radiopaque platinum tip is easily visualized under fluoroscopy. Once in place, the polyurethane balloon tip inflates symmetrically, so the blockage is pressed to the vessel walls in a consistent, uniform manner.
